Section 1: Technical Evidence

2024 analysis: 79 complete-case Ortsteile from 88 workbook areas; no missing value imputation.

Three indicators: unemployment quotient, social-insurance employment participation, and SGB II benefit receipt under age 65. Percentages have different denominators.

Highest composite scores: Ohlenhof, Gröpelingen, Grohn, Blumenthal, Lindenhof. Highest TOPSIS closeness: Ohlenhof, Gröpelingen, Blumenthal, Lindenhof, Tenever.

Rank Spearman correlation: 0.9743. K-means selects 2 nominal profiles; silhouette 0.5277.

Scores are relative to the covered sample and describe partial disadvantage. They do not establish individual poverty, causal effects, current 2026 conditions or an allocation rule.

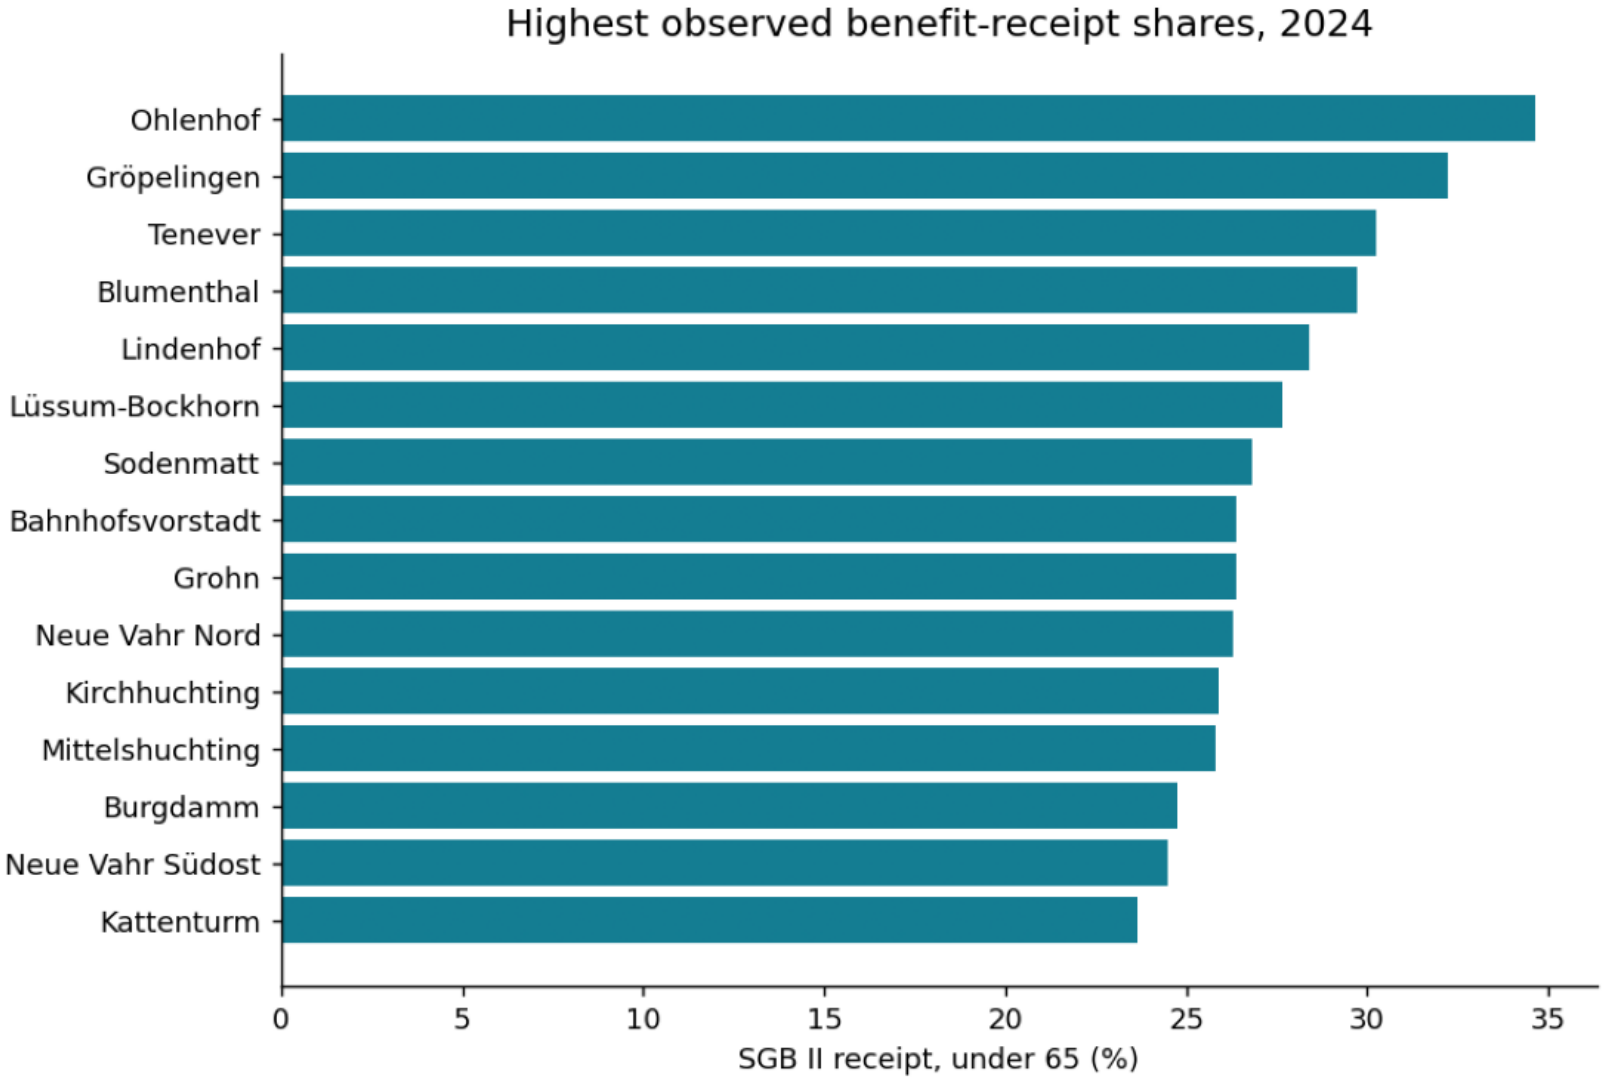

Historical change claims remain blocked. Boundary/definition history and exact current reference dates need municipal verification. Income context is kept at 2020.

Discussion prompts: where might planners investigate labour-market and benefit-related service needs? What contextual and resident evidence is needed before allocating resources? Demographic identities are not scored. Urban mobility and environmental outcomes need additional data.

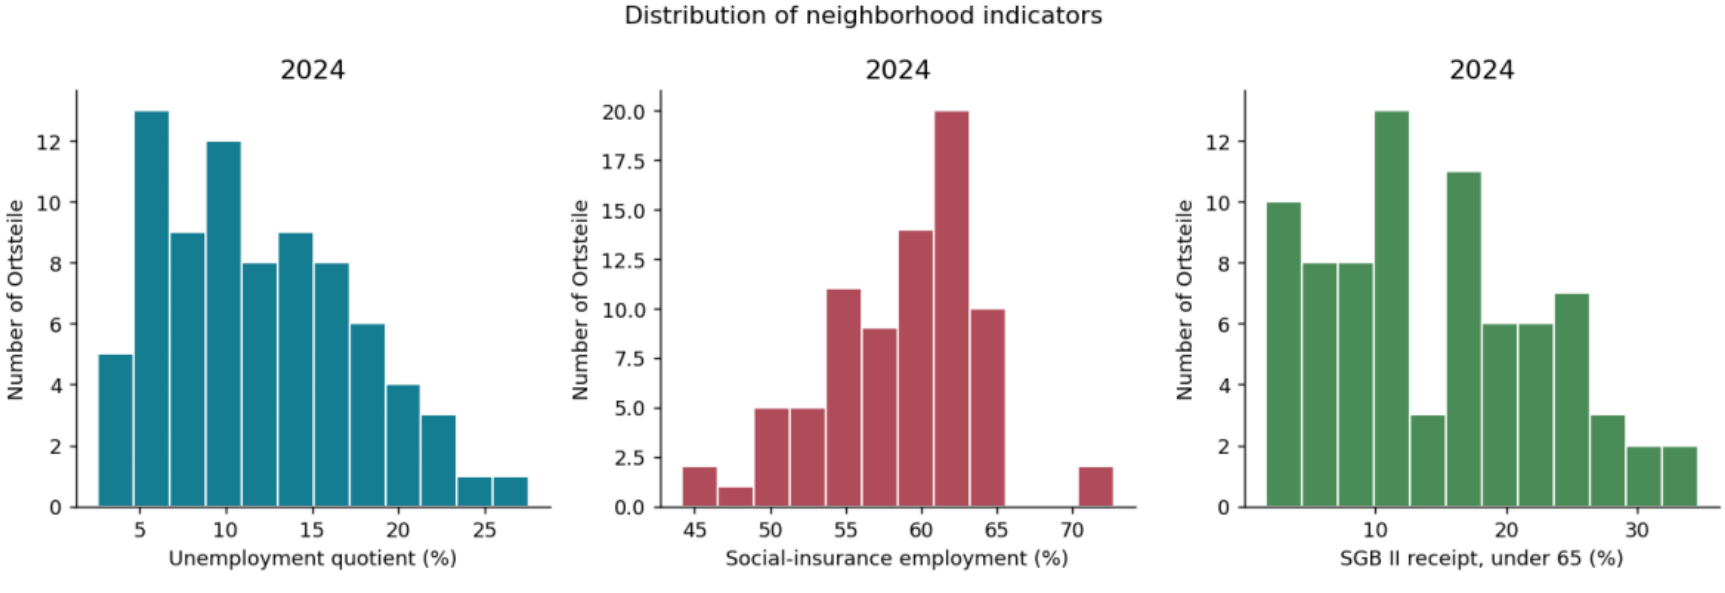

2024 composite results: highest 10 covered Ortsteile

Ortsteil	Score	Rank
Ohlenhof	0.943	1
Gröpelingen	0.876	2
Grohn	0.821	3
Blumenthal	0.795	4
Lindenhof	0.777	5
Tenever	0.769	6
Lüssum-Bockhorn	0.724	7
Kirchhuchting	0.708	8
Bahnhofsvorstadt	0.698	9
Fähr-Lobbendorf	0.693	10

Reporting years and units are identified in table headings; ranks refer only to covered Ortsteile.
